Connect the driver input to a power supply (a 12V battery will do) and wind the Constant Voltage pot fully clockwise (it will click). Then with your multimeter on DC amps connect it across the output terminals. These units seem to come set to 3A or so, so adjust the Constant Current pot until the current is down to 0.7A (700mA) or thereabouts.

Para correntes de 0,99A ou maiores, o módulo do amperímetro funciona bem, está correto (figura 12). Mas, abaixo de 200mA, o instrumento aumenta o erro e chega a uma casa decimal: quando a corrente é 100mA, indica 0,01A (figura 13). Deveria indicar 0,10A. Abaixo de 90mA, não indica nada (tinha que mostrar 0,09 e exibe 0,00 - figura 14).

The core feature of the adjustable high-voltage regulator is an implicit constant-current source operation. The constant-current operation of the OpAmp driving the pass MOSFET to maintain a fixed 10-volt voltage drop across the 1k source resistor implies a constant-current flow of 10mA through the resistor, and, in turn, a constant-current 10mA ...
