digital clock is a repeating digital waveform used to step a digital circuit through a sequence of states. We will introduce the 555 timer chip and use it to generate a clock signal. Digital circuits that are able to step through a sequence of states with the aid of flip-flops and a clock are called sequential logic.

In digital electronics, a digital signal is a pulse train (a pulse amplitude modulated signal), i.e. a sequence of fixed-width square wave electrical pulses or light pulses, each occupying one of a discrete number of levels of amplitude. A special case is a logic signal or a binary signal, which varies between a low and a high signal level.. The pulse trains in digital circuits are typically ...

Decoder. The combinational circuit that change the binary information into 2 N output lines is known as Decoders. The binary information is passed in the form of N input lines. The output lines define the 2 N-bit code for the binary information.In simple words, the Decoder performs the reverse operation of the Encoder.At a time, only one input line is activated for simplicity.
