Un generador lineal congruencial (GLC) es un algoritmo que permite obtener una secuencia de números pseudoaleatorios calculados con una función lineal definida a trozos discontinua. Es uno de los métodos más antiguos y conocidos para la generación de números pseudoaleatorios. [1] La teoría que sustenta el proceso es relativamente fácil de entender, el algoritmo en si es de fácil ...

For example, the book "Numerical Recipes in Fortran" is both a good text on scientific programming algorithms and a good introduction to how to put together codes. More recent editions include chapters on how to program in a mixed-language environment and parallel programming. Another example is "Modern Fortran in Practice" written by Arjen Markus.

It is believed the problem with HDF 4 is that everything is compiled with the F77 compiler, but at some point some Fortran 90 code slipped in there. So compilers that can handle both FORTRAN 77 and Fortran 90 (gfortran, pgfortran, etc) are fine. But compilers specific to one or the other (pgf77, pgf90) won't work.
