Fluorine's chemistry is dominated by its strong tendency to gain an electron. It is the most electronegative element and elemental fluorine is a strong oxidant. The removal of an electron from a fluorine atom requires so much energy that no known reagents are known to oxidize fluorine to any positive oxidation state.. Therefore, fluorine's only common oxidation state is ?1.

História Origem e evolução. Segundo a teoria Alpher-Bethe-Gamov, o hidrogénio formou-se na época da nucleossíntese primordial, quando o Universo expandiu e arrefeceu o suficiente para permitir a ligação entre eletrões e protões. [13] O deutério formou-se por captura de neutrões. [13] A junção de mais neutrões e subsequente decaimento levou à formação de hélio e lítio.

Abstract The phase-field method has recently emerged as a powerful computational approach to modeling and predicting mesoscale morphological and microstructure evolution in materials. It describes a microstructure using a set of conserved and nonconserved field variables that are continuous across the interfacial regions. The temporal and spatial evolution of the field variables is governed by ...
