Today I tried to read out the CPU speed information of a 4-wire CPU fan (Intel DTC AAL03) and additionally I tried to control the fan speed by PWM. The 4-wire system looks like that: black – GND yellow – +12VDC green – pulse tachometer (for my Intel CPU cooler this is 2 pulses per revision) blue – PWM value for controlling the fan

sort of explains the pinouts for this kind of fan. The four wires are: ground, +12V, PWM input, and speed sense output. I think if you can figure out which two wires are ground and +12V, and leave the other wires open, i.e. not connected, then the fan will turn at full speed. seandogue

Conversely a PWM controller for PWM fans – such as the one featured in this article – doesn't modulate the 12V supply line but instead sends a PWM signal along a different supply line (the magic “fourth wire”) to a more advanced 12 VDC motor, leaving the 12 V supply line uninterrupted. Designated PWM fans not only have internal ...
