Probability Models - Yale University

In this section, we discuss one of the most fundamental concepts in probability theory. Here is the question: as you obtain additional information, how should you update probabilities of events?

### Logistic Regression: Calculating a Probability

Probability is a measure quantifying the likelihood that events will occur. Probability is a number between 0 and 1, where, roughly speaking, 0 indicates impossibility and 1 indicates certainty. The higher the probability of an event, the more likely it is that the event will occur.

### A FIRST COURSE IN PROBABILITY

**Probability Models** A probability model is a mathematical representation of a random phenomenon. It is defined by its sample space, events within the sample space, and probabilities associated with each event.. The sample space  $S$  for a probability model is the set of all possible outcomes.. For example, suppose there are 5 marbles in a bowl. One is red, one is blue, one is yellow, one is green ...

The sigmoid function yields the following plot: Figure 1: Sigmoid function. If  $z$  represents the output of the linear layer of a model trained with logistic regression, then  $\text{sigmoid}(z)$  will yield a value (a probability) between 0 and 1. In mathematical terms:
