The semantic information is not considered in the existing approaches. In this model, we address the issue of semantically clustering the web services using lattices based on multi-agent systems. Lattice based clustering is achieved using Formal Concept Analysis (FCA). A concept lattice is feasible for small to medium size collections.

in [3], can be naturally modelled and implemented in a document-term concept lattice com-puted from a document collection. Formal Concept Analysis (FCA) is a theoretical as well as practical framework for clas-sifying objects in a concept lattice based on the relations they have through the attributes they share [12].

An approach of semantic analysis using concept lattice as background knowledge is proposed. An important problem of semantic analysis is semantic heterogeneity that includes managing the diversity in knowl- edge. Therefore a process of semantic matching is de ned.

This lattice, which is a sub-order of the subset lattice, is closely related to Wille's concept lattice in formal concept analysis.

Accordingly, we use FCA to compute a concept lattice, which is considered both a semantic index to organize documents and a search space to model terms. We introduce the notions of cousin concepts and classification-based reasoning for navigating the concept lattice and retrieve relevant information based on the content of concepts.

A LATTICE-BASED APPROACH FOR NEWS CHAIN CONSTRUCTION Each news article and column can be part of a manually created news story or chain by journalists and columnists. However, increasing amounts of data published by news companies each year makes manual analysis thus creation of news stories and chains almost impossible.

is based on presence of same attribute values); concepts are hierarchically organized (specific vs. general). For this FCA-based rule evaluation approach, a lattice hierarchy is used to compute conceptual distance between concepts. A concept is usually composed of two parts: extension and intention. Extension covers all the objects belonging to

Lattice model (finance) In finance, a lattice model is a technique applied to the valuation of derivatives, where a discrete time model is required. For equity options, a typical example would be pricing an American option, where a decision as to option exercise is required at "all" times (any time) before and including maturity.

The Discrete Element Method (DEM), also known as Distinct Element Method (DEM), is extensively used to study divided media such as granular materials. When brittle failure occurs in continuum such as concrete or ceramics, the considered media can be viewed as divided.

A concept lattice-based kernel for SVM text classification
A lattice-based model is used to value derivatives; it employs a binomial tree to show different paths the price of the underlying asset may take over the derivative's life. The name of the model is derived from the appearance of the binomial tree that depicts the possible paths the derivative's price may take.

It combines corpus based semantics and Formal Concept Analysis in order to deal with semantic and structural properties for concepts discovered in tasks such as generation of association rules. Experiments show the promise of our evaluation method to effectively assess discovered patterns when compared with other state-of-the-art evaluation methods.

In this paper we construct such a threshold cryptosystem, based on a variant of Regev s system [Reg05]. We show our scheme semantically secure based on a worst-case lattice problem using a recent reduction of Peikert [Pei09]. To the best of our knowledge, it is the first lattice-based threshold cryptosystem.
