Acid Base Theories Section Review

Organic chemists use two acid-base theories for interpreting and planning their work: the Brønsted theory and the Lewis theory. Brønsted Theory. According to the Brønsted theory, an acid is a proton donor, and a base is a proton acceptor. In an acid-base reaction, each side of the equilibrium has an acid and a base reactant or product, and ...

The Arrhenius definition of acid-base reactions is a development of the "hydrogen theory of acids". It was used to provide a modern definition of acids and bases, and followed from Arrhenius's work with Friedrich Wilhelm Ostwald in establishing the presence of ions in aqueous solution in 1884.

But conspiracy theories are not new. 'They've always been a way of thinking that people turn to in times of crisis, when things are not clear,' says social psychologist Karen Douglas from the University of Kent in the UK. A major focus of many conspiracy theories is the chemicals in our water, food and in the air we breathe.

Humic substances are organic compounds that are important components of humus, the major organic fraction of soil, peat, and coal (and also a constituent of many upland streams, dystrophic lakes, and ocean water). For a long era in the 19th and 20th centuries, humic substances were often viewed through a lens of acid-base theory that described humic acids, as organic acids, and their ...

Acid/Base Chemistry: Titration Lab

The acid-base reaction class has been studied for quite some time. In 1680, Robert Boyle reported traits of acid solutions that included their ability to dissolve many substances, to change the colors of certain natural dyes, and to lose these traits after coming in contact with alkali (base) solutions. In the eighteenth century, it was recognized that acids have a sour taste, react with ...

Valproic acid is a branched-chain saturated fatty acid that comprises of a propyl substituent on a pentanoic acid stem. It has a role as an anticonvulsant, a GABA agent, an EC 3.5.1.98 (histone deacetylase) inhibitor, a teratogenic agent, a psychotropic drug, a neuroprotective agent and an antimanic drug. It is a branched-chain saturated fatty acid and a branched-chain fatty acid.

Tryptophan is the least plentiful of all 22 amino acids and an essential amino acid in humans (provided by food), Tryptophan is found in most proteins and a precursor of serotonin. Tryptophan is converted to 5-hydroxy-tryptophan (), converted in turn to serotonin, a neurotransmitter essential in regulating appetite, sleep, mood, and pain. Tryptophan is a natural sedative and present in dairy ...

Acetic acid is an important industrial commodity chemical, with a world demand of about 6 million tonnes per year and many industrial uses. The preferred industrial method for its manufacture is by the carbonylation of methanol and this accounts for approximately 60 per cent of the total world acetic acid manufacturing capacity. The carbonylation of methanol, catalysed by rhodium, was invented ...

Most laboratory chemical spills are cleaned up in a similar manner, but acid and base spills require an extra step. What is this extra step? Select one: Neutralize the spill before cleaning it up. Be sure to replace the spilled acid or base. Tell all other lab participants to evacuate the lab as quickly as possible.

A nucleotide is composed of three distinctive chemical sub-units: a five-carbon sugar molecule, a nucleobase—which two together are called a nucleoside—and one phosphate group. With all three joined, a nucleotide is also termed a "nucleoside monophosphate", "nucleoside diphosphate" or "nucleoside triphosphate", depending on how many phosphates make up the phosphate group.
