The method combines two key modules to form an Editorial Agent and Language Model converter (EALM). The agent predicts edit actions (e.t., delete, keep, and replace), and then the LM converter deterministically generates a summary on the basis of the action signals. Q-learning is leveraged to train the agent to produce proper edit actions.

An SMPS converter uses a high-speed switched transistor(s) to switch the input power through to the output. The basic topologies of SMPS are Buck (step down), Boost (step up), and Buck-Boost (combination of the two). There are some other advanced and varied topologies, but, in many respects, they are just derivatives of these fundamental types.
