Categorical Data Analysis

34. Yes, this would be an occurrence of Simpson's paradox. One could display the data as a  $2 \times 2 \times K$  table, where rows = (Smith, Jones), columns = (hit, out) response for each time at bat, layers = years. This happens if Jones tends to have relatively more observations (i.e., "at bats") for years in which his average is high.
