The amount of energy released when an electron is added to a neutral atom or molecule to form a negative ion. Generally, nonmetals have more positive electron affinity than metals. Chlorine most strongly attracts extra electrons; mercury most weakly attracts an extra electron.

Sodium's electronegativity is 0.9, while chlorine's is 3.0. The difference is 2.1, which is rather high, and so sodium and chlorine form an ionic compound. With 2.1 for hydrogen and 3.5 for oxygen, the electronegativity difference is 1.4. We would expect a very polar bond, but not so polar that the O-H bond is considered ionic.
