for the Fibonacci numbers.. Generating functions are very useful in combinatorial enumeration problems. For example, the subset sum problem, which asks the number of ways to select out of given integers such that their sum equals , can be solved using generating functions.. The generating function of of a sequence of numbers is given by the Z-transform of in the variable (Germundsson 2000).

The ratio of Fibonacci numbers F 25001 and F 25000, each over 5000 digits, yields over 10,000 significant digits of the golden ratio. The decimal expansion of the golden ratio ? [3] has been calculated to an accuracy of ten trillion (1 × 10 13 = 10,000,000,000,000) digits.

In computing, a linear-feedback shift register (LFSR) is a shift register whose input bit is a linear function of its previous state.. The most commonly used linear function of single bits is exclusive-or (XOR). Thus, an LFSR is most often a shift register whose input bit is driven by the XOR of some bits of the overall shift register value.

Natural numbers such that there is exactly one base b such that the base-b alternate digital sum is 0 (see A239707). Equivalently: Numbers p > 1 such that b = p-1 is the only base >= 1 for which the base-b alternate digital sum is 0. Equivalently: Numbers p > 1 such that the base-b alternate digital sum is <= 0 for all bases 1 <= b < p-1. (End)

Pythagorean triangles from the Fibonacci Series C W Raine Scripta Mathematica vol 14 (1948) page 164 seems to be the earliest reference to this method but only for the Fibonacci numbers. Fibonacci Number Triples A F Horadam American Mathematical Monthly vol 68 (1961) pages 751-753 gives the generalisation to any two starting numbers.
