4 1. The Physical Origins of Partial Differential Equations. The initial condition is $u(x,0) = 0$ and the boundary condition is $u(0,t) = n_0$. To solve the equation go to characteristic coordinates $\xi = x - ct$ and $\tau = t$. Then the PDE for $N = N(\xi, \tau)$ is $N_\tau = -r \sqrt{N}$. Separate variables and integrate to get $2 \sqrt{N} = -r\tau + \phi(\xi)$.**

ing ordinary and partial differential equations. The transform is applied to PDEs on finite and infinite spatial domains. Fourier transforms, and Fourier sine and cosine transforms, in Chapter 11 are developed from Fourier integrals. They are then applied to problems on infinite and semi-infinite domains. Hankel transforms are applied to problems in polar and cylindrical coordinates.
