When the attractive force is strong, the nucleus pulls electrons closer to it, resulting in a smaller atomic/ionic size. On the other hand, a weaker attractive force is not as effective at retaining the electrons, and results in larger atomic/ionic radius. The relationships between (Z_{eff}) and size are summarized as follows:

Atomic Structure and Properties

Increase going up the periodic table, because electrons in lower shells are closer to the nucleus and less repelled by other electrons, e.g.: Li E I1 = 520 kJ/mol, Na E I1 = 496 kJ/mol ; Increase going right across the periodic table, because effective nuclear charge (charge felt by valence electrons) increases across a given row of the periodic table, e.g.:
