Note that a compound: consists of atoms of two or more different elements bound together, can be broken down into a simpler type of matter (elements) by chemical means (but not by physical means), has properties that are different from its component elements, and; always contains the same ratio of its component atoms. Mixtures

**Atoms, Elements and Compounds | Good Science**  
Compounds are substances that are created when two or more elements are chemically joined. The atoms of those elements attach to each other by chemical bonds. When elements bond in this manner to form compounds, they lose their individual properties and take on the new properties of the compound that their bonding creates.
