How will we control and exploit the nanoworld? The scale of the nanoworld is smaller than a wavelength of visible light. This places it between the classical world of microscopic objects such as living cells and the quantum world of atoms and molecules.

Photonic molecules are formed when individual (massless) photons "interact with each other so strongly that they act as though they have mass". In an alternative definition (which is not equivalent), photons confined to two or more coupled optical cavities also reproduce the physics of interacting atomic energy levels, and have been termed as photonic molecules.

Light and Photons "An electron has a natural orbit that it occupies, but if you energize an atom you can move its electrons to higher orbitals [shells]. A photon of light is produced whenever an electron in a higher-than-normal orbit falls back to its normal orbit.
