Radio-frequency identification (RFID) uses electromagnetic fields to automatically identify and track tags attached to objects. An RFID system consists of a tiny radio transponder, a radio receiver and transmitter. When triggered by an electromagnetic interrogation pulse from a nearby RFID reader device, the tag transmits digital data, usually an identifying inventory number, back to the reader.

The earliest driver-less technology was envisioned for life driving: one of the earliest cases of driver-less technology was the CMU (Carnegie Mellon University) system [1,2], in which a system based on artificial intelligence computing and the computer control was developed by CMU (Carnegie Mellon University). Subsequently, quite a few scholars have developed more and more control systems ...

The history of condoms goes back at least several centuries, and perhaps beyond. For most of their history, condoms have been used both as a method of birth control, and as a protective measure against sexually transmitted diseases. Condoms have been made from a variety of materials; prior to the 19th century, chemically treated linen and animal tissue (intestine or bladder) are the best ...
