Alphabetical List of tools. The Sacado package provides automatic differentiation tools for C++ applications and is part of the larger Trilinos framework. It provides both forward and reverse modes, and leverages expression templates in the forward mode and a simplified tape data structure in the reverse mode for improved efficiency.

Automatic differentiation of algorithms - ScienceDirect

In mathematics and computer algebra, automatic differentiation (AD), also called algorithmic differentiation or computational differentiation, is a set of techniques to numerically evaluate the derivative of a function specified by a computer program. AD exploits the fact that every computer program, no matter how complicated, executes a sequence of elementary arithmetic operations (addition, subtraction, multiplication, division, etc.) and elementary functions (exp, log, sin, cos, etc.).

Forward-mode automatic differentiation. The effect is remarkably simple: we just need to initialize $dx = 1$ and $dy = 0$ as the seed values for the algorithm. Hence, by choosing the seeds $dx = 1$ and $dy = 0$, the variable dz will contain the value of the derivative upon completion of the program. Similarly, if we want ...
