activities of the cells, tissues, and organs throughout the body, and to coordinate the many responses of the individual organism to its environment.

## **Name Period Regents Biology Date ANIMAL BODY SYSTEMS ...**

Homeostasis refers to the relatively stable state inside the body of an animal. Animal organs and organ systems constantly adjust to internal and external changes in order to maintain this steady state. Examples of internal conditions maintained homeostatically are the level of blood glucose, body temperature, blood calcium level.

relatively constant body temperature, it is classified as a warm-blooded animal and called an endotherm.

## **Chapter 11: Introduction to the Body's Systems – Concepts ...**

All of the systems in an organism are interconnected. A simple example is the connection between the circulatory and respiratory systems. As blood circulates through your body, it eventually needs fresh oxygen ( $O_2$ ) from the air. When the blood reaches the lungs, part of the respiratory system, the blood is re-oxygenated. Your stomach, part of the digestive system, constantly interacts with your endocrine system and spreads hormones throughout your body.

the spinal cord and regulates some of the most important and basic functions of the nervous system including breathing, swallowing, digestion, sleeping, walking, and sensory and motor information integration.

### **Biology4Kids.com: Animal Systems**

An organ system is a higher level of organization that consists of functionally related organs. For example vertebrate animals have many organ systems, such as the circulatory system that transports blood throughout the body and to and from the lungs; it includes organs such as the heart and blood vessels. Organisms are individual living entities.
