Biological control is a
component of an integrated
pest management strategy. It
is defined as the reduction
of pest populations by
natural enemies and
typically involves an active
human role. Keep in mind
that all insect species are
also suppressed by naturally
occurring organisms and
environmental factors, with
no human input.

Restoration on Private Lands
Pt. 2 - Implementation ...

An example of a biological control system involving a predator, a parasite and a pest is a backyard vegetable garden where caterpillars feed on plants, tiny parasitic wasps lay eggs inside the caterpillars, and black-capped chickadees eat the caterpillars. The birds and wasps compete for the available caterpillars.

Biological Control - Journal
- Elsevier

Biological control is the beneficial action of parasites, pathogens, and

Introduction The recorded
history of biological
control may be considered as
dating from Egyptian records
of 4,000 years ago, where
domestic cats were depicted
as useful in rodent control.
Insect Predation was
recognized at an early date,
but the significance of
entomophagy and exploitation
was lost except for a few
early human populations in
Asia where a sophisticated
agriculture had developed.

in Livestock - Krishi Jagran

July 22 1964 June 30 1965
Biological control or
biocontrol is a method of
controlling pests such as
insects, mites, weeds and
plant diseases using other
organisms. It relies on
predation, parasitism,
herbivory, or other natural
mechanisms, but typically
also involves an active
human management role. It can
be an important component of
integrated pest management
(IPM) programs.
