The byte is a unit of digital information that most commonly consists of eight bits. Historically, the byte was the number of bits used to encode a single character of text in a computer and for this reason it is the smallest addressable unit of memory in many computer architectures. To disambiguate arbitrarily sized bytes from the common 8-bit

Mesopotamia is a name for the area of the Tigris-Euphrates river system, corresponding to modern-day Iraq, Kuwait, the northeastern section of Syria and to a much lesser extent southeastern Turkey and smaller parts of southwestern Iran. Download our worksheet and fact file collection today.

Modem - Wikipedia

I really like how clean Broofa's answer is, but it's unfortunate that poor implementations of `Math.random` leave the chance for collision.. Here's a similar RFC4122 version 4 compliant solution that solves that issue by offsetting the first 13 hex numbers by a hex portion of the timestamp, and once depleted offsets by a hex portion of the microseconds since pageload.
