reasons of failure in exposed equipment such as a superheater, a thorough investigation of more than one probable cause is usually required. This article focuses on a failure analysis of a boiler located in a chemical plant. After a leak was discovered, several cracks on the superheater tubes were identified as its main cause.

### ROOT-CAUSE ANALYSIS OF SUPERHEATER-TUBE FAILURE

In each case the damaged tubes were positioned at the extreme ends of the boilers, close to the main framework. Two of the failures were in cold formed bends (one at a top bend and one at a bottom bend). The third failure was in a straight section of tube. Causes

This type of failure is usually indicated by a "thin-lipped" burst of the boiler tube. These failures occur when water circulation in the tube is interrupted, and the flue gas temperatures cause a rapid overheating of the metal to a point where the metal becomes highly plastic and a violent burst occurs.

falling slag erosion, and coal particle erosion can cause erosion on the boiler tubes. Fly ash erosion, is a significant boiler tube failure concern, occurs in the regions with high local flue gas velocities, with high ash loading, and with abrasive particles such as quartz Corrosion: Deterioration and loss of material due to chemical attack.

boiler tube failures. i.e. same failure mechanism, same root-cause, same tube, etc., occur in fossil-fired boilers – Describe the six requirements for a formalized boiler tube failure prevention program – Discuss twenty-two common tube failure mechanisms in terms of typical locations, appearances, root-causes, corrective action, etc 3 ...

Finding the Root Cause of Boiler Tube Failures

CAUSES OF TUBING FAILURES The purpose of the following information is to focus attention on these facts: The environmental conditions within the boiler can be highly aggressive and alter the microstructure of tubing. Stresses caused by external loads, or induced by cold forming operations, uneven cooling or welding, may substantially lower the resistance of tubing [...]

### Boiler Tube Failures - eecpowerindia.com

Boiler tube failures are the main causes of forced outages of power generating units. Most of the common failure occurs in water wall tubes, superheater/reheater tubes, and economizer tubes. More than 80% of unscheduled boiler shutdown is due to boiler tube failure.

### Boiler Tube Failure Investigation

The tube failures in a boiler during initial phase of operation are different from the types that occur after prolonged operation. During the initial period of operation of boiler the type of tube failures seen are short term overheating, weld failures, material defects, chemical excursion failure, and sometimes fatigue failures.

However, in the event of tube failure, a welded repair must be carried out. Alternatively the tube can be plugged at either end, but refractory materials must be placed over the failed tube to protect the insulation behind it. With tangent tube construction a failed tube can be plugged and the boiler operated normally without further attention.
