tions implicit in the boundary layer approximation break down for the region of slow flow around the leading edge. The solution given by the boundary layer approximation is not valid at the leading edge. It is valid downstream of the point $x = 0$. We would like to reduce the boundary layer equation (3.27) to an equation with a single dependent ...

Fig. 19.2: Blasius solution for a semi-infinite plate. The horizontal dotted line indicates the thickness of the boundary layer, where the velocity is equal to 99% of the interior velocity. corresponding to $\eta = 4.9$. This confirms one of the basic hypotheses, i.e., that the thickness of the boundary layer increases very slowly.
