Cutting-plane method - Wikipedia  
Dynamic programming is both a mathematical optimization method and a computer programming method. The method was developed by Richard Bellman in the 1950s and has found applications in numerous fields, from aerospace engineering to economics.. In both contexts it refers to simplifying a complicated problem by breaking it down into

Piecewise linear approximation - optimization

In mathematical optimization, the cutting-plane method is any of a variety of optimization methods that iteratively refine a feasible set or objective function by means of linear inequalities, termed cuts. Such procedures are commonly used to find integer solutions to mixed integer linear programming (MILP) problems, as well as to solve general, not necessarily differentiable convex ...

The branch and refine algorithm is based on the piecewise linear approximation. It is an efficient way to solve a problem for the global optimum. It uses piecewise linear approximations to provide global lower bounds for the MINLP. From there the feasible solutions provide the upper bounds of the MINLP.
