Students apply high school differential calculus and physics to design 2D roller coasters in which the friction force is taken into consideration. Student teams first mathematically design the coaster path (using what they learned in the associated lesson) and then use foam pipe wrap insulation material and marbles to build and test small-size prototype models that match their design dimensions.

Calculus and physics are directly related to roller coaster design. There are two types of energy used in roller coasters: potential energy, and kinetic energy. The potential energy is the amount of energy available for the coaster to have. It is calculated by the equation  $PE=mgh$  where  $m$ =mass,  $g$ =gravity, and  $h$ =height.
