### 11.4 Meiosis I - Mt Hood Community College Biology 102

Meiosis is a process in which the number of chromosomes per cell is cut in half through the separation of homologous chromosomes in a diploid cell. Meiosis usually involves two distinct divisions, called meiosis I and meiosis II. By the end of meiosis II, the diploid cell becomes four haploid cells.

### Biology Chapter 11-4 Meiosis Answer Key

11.4 Meiosis I. Early in meiosis I, the chromosomes can be seen clearly microscopically. As the nuclear envelope begins to break down, the proteins associated with homologous chromosomes bring the pair close to each other. The tight pairing of the homologous chromosomes is called synapsis. In synapsis, the genes on the chromatids of the ...

### 11 4 Meiosis - houstonisd.org

Phases of Meiosis. On the lines provided, identify the stage of meiosis I or meiosis II in which the event described occurs. 9. Each replicated chromosome pairs with its corresponding homologous chromosome. 10. Crossing-over occurs between tetrads. 11. Paired homologous chromosomes line up across the center of the cell. 12.
