Most proteins are soluble in water, in alcohol, in dilute base or in various concentrations of salt solutions. Proteins have the characteristic coiled structure which is determined by the sequence of amino acids in the primary polypeptide chain and the stereo configuration of the radical groups attached to the alpha carbon of each amino acid.

Balancing rations for anions affects the cow's acid-base status, raising the amount of calcium available in the blood. Urine acidity is affected by these changes in the cow's acid-base status, Table 4. Checking urine pH can help producers and veterinarians monitor the effectiveness of an anionic ration.

Linoleic acid [18:2(n-6)] cannot be synthesized endogenously but can be elongated and desaturated to form arachidonic acid [20:4(n-6)]; thus, the requirement for n-6 fatty acids can be met through dietary linoleic acid. Early estimates of the requirement for n-6 fatty acids were made by using growth and skin condition as response criteria.
