We will discuss geometric objects later in this chapter, in order to understand the different types of histograms. The built-in graphics package in R does not have a lot of features, so ggplot2 has become the package of choice. For the next exercises, we will continue to investigate making plots using ggplot2.

Introduction to ggplot2 - Applied Data Visualization with ...
In this chapter, we'll delve into how to use R ggplot2 as a tool for graphical data analysis, progressing from just plotting data to applying a variety of statistical methods. This includes a variety of linear models, descriptive and inferential statistics (mean, standard deviation and confidence intervals) and custom functions.

Part 3: Top 50 ggplot2 Visualizations - The Master List, applies what was learnt in part 1 and 2 to construct other types of ggplots such as bar charts, boxplots etc.

base package and ggplot2, part 2 - lm | R
At present, ggplot2 cannot be used to create 3D graphs or mosaic plots. Use I(value) to indicate a specific value. For example size=z makes the size of the plotted points or lines proporational to the values of a variable z. In contrast, size=I(3) sets each point or line to three times the default size.

For example, in base R, if you design a new graphic, it's composed of raw plot elements like points and lines, and it's hard to design new components that combine with existing plots. In ggplot2, the expressions used to create a new graphic are composed of higher-level elements like representations of the raw data and statistical transformations, and can easily be combined with new datasets and other plots.
