The integral symbol in the previous definition should look familiar. We have seen similar notation in the chapter on Applications of Derivatives, where we used the indefinite integral symbol (without the  $(a)$  and  $(b)$  above and below) to represent an antiderivative. Although the notation for indefinite integrals may look similar to the notation for a definite integral, they are not the same.

First we find the intersection point of the curves:  $x^2 + 4x = x^2 - 6x + 5 \Rightarrow 10x = 1 \Rightarrow x = 0.1$ . The intersection point we ...

CHAPTER 4 Derivatives by the Chain Rule 1 4.1 The Chain Rule You remember that the derivative of  $f(x)g(x)$  is not  $(df/dx)(dg/dx)$ . The derivative of  $\sin x$  times  $x^2$  is not  $\cos x$  times  $2x$ . The product rule gave two terms, not one term. But there is another way of combining the sine function  $f$  and the squaring function  $g$  into a single function.
