8-2 Laminar and Turbulent Flow 8-1C Solution We are to compare pipe flow in air and water. Analysis Reynolds number is inversely proportional to kinematic viscosity, which is much smaller for water than for air (at 25 C, air = $1.562 \cdot 10^{-5} \text{ m}^2/\text{s}$ and water = $0.891 \cdot 10^{-3}/997 = 8.9 \cdot 10^{-7} \text{ m}^2/\text{s}$). Therefore, for the same diameter and

8.8 Microscale Internal Flow Many new technologies involve microscale internal flow with $D \approx 100 \mu\text{m}$. For gases, the results of Chapters 6 through 8 are not expected to apply when $D \approx 10 \mu\text{m}$. For liquids, some features of previous results, e.g., friction factor (8.19), pressure drop (8.22a), and transition criterion (8.2) remain applicable.
