The Nature of Soil 1. A layer of rock and mineral fragments produced by weathering covers the surface of Earth. 2. Weathering gradually breaks rocks into smaller and smaller fragments. 3. Plants and animals add organic matter, the remains of once-living organisms, to the rock fragments. • Soil is a mixture of weathered rock, decayed

Chapter 5 Weathering and Soil - Physical Geology

CHAPTER 6 (Weathering and Soil) 1. Weathering is a term which describes the general process by which rocks are broken down at the Earth's surface into such things as sediments, clays, soils and substances that are dissolved in water.. 2. The process of weathering typically begins when the earth's crust is uplifted by tectonic forces.
