Introduction Sodium

hexanitrocobaltate, with the chemical formula

$\text{Na}_3[\text{Co}(\text{NO}_2)_6]$, is a classic coordination compound where cobalt has 6 as the coordination number and a rather uncommon oxidation state for this element, which is -3, as shown in the structure below: In analytical chemistry, it is used for the quantitative determination of K^+ or NH_4^+ , which precipitate as...

chemistry ...**

As these experiments involve the use of two very corrosive reagents, the reliability of the class in terms of both manipulative skills and behaviour is important. However, the quantities actually used are small, and risks can be minimised by advance preparation of reaction vessels with these reagents already measured out.
