- same then the $\chi^2 = 0$
- If the χ^2 value is 0 or is small then the data fits your hypothesis (the expected values) well.
- By calculating the χ^2 value you determine if there is a statistically significant difference between the expected and actual values.

The Chi Squared test is to test the null hypothesis . The chi squared test will evaluate if there is a significant difference between your observed results and the expected results you predicted. The formula is: $X^2 = \frac{(O - E)^2}{E}$. $O =$ observed number of individuals with (red-eyed/white-eyed)

The chi-square test for a two-way table with r rows and c columns uses critical values from the chi-square distribution with $(r - 1)(c - 1)$ degrees of freedom. The P-value is the area under the density curve of this chi-square distribution to the right of the value of the test statistic. The Chi-Square Distributions
