☐☐ Reading time: 1 minute
Qualitative structural analysis might not be familiar to structural engineers. The usual way of analysis of structures is numerical (quantitative) method in which the structural designers should determine values for dimensions and loads and compute bending moments and reactions. However, there is an important step before numerical

Plastic saturated soils (silts and clays) usually have lower shear strength than non-plastic cohesion less soil and are more susceptible to bearing capacity failure. For saturated plastic soils, the bearing capacity often has to be calculated for different condition. Total Stress Analysis (Short term condition) that uses the un-drained shear strength of the plastic soil.
