I would strongly advise for people who have a dynamic microphone in particular as you can't use phantom power directly on a dynamic microphone such as the shure sm7B. With the CL-1 you can use phantom power as the phantom power goes into the microphone pre-amp and not into the microphone itself.

An operational amplifier (often op amp or opamp) is a DC-coupled high-gain electronic voltage amplifier with a differential input and, usually, a single-ended output. In this configuration, an op amp produces an output potential (relative to circuit ground) that is typically 100,000 times larger than the potential difference between its input terminals.

Another more interesting relation is the equation of the closed loop gain ( $G_{CL}$ ), i.e., the overall gain of the amplifier when negative feedback exist. This relationship is very simple, In feedback amplifier applications, the term  $A?$  (referred to as the open loop gain) is larger than 1.

The PAM8302A is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output THD and PSRR as low as possible. Power supply decoupling affects low frequency response. Optimum decoupling is achieved by using two capacitors of different types that target different types of noise on the power supply leads.
