The physics of the transformer involves two basic laws. One is Faraday's law of induction: the electromotive force (emf) induced across the ends of a coil of N turns is $V = -N \frac{d\phi}{dt}$, and the other is Kirchhoff's second law: in a closed loop of a circuit, the sum of the emfs is equal to the sum of potential differences, i.e. $\sum \text{emfs} = \sum \text{pds}$.

The experimental discovery of a new particle at CERN is a very important issue, the most important one in the last decades. However, the announcement that this particle is the Higgs boson is still premature. More data, time, and analysis are necessary before we can reach this conclusion.
