classified into two main categories: exact and heuristic methods. Exact algorithms are guaranteed to find an optimal solution and to prove its optimality for every instance of a COP. The run-time, however, often increases dramatically with the instance size, and often only small or moderately-sized instances can be practically

Combining heuristic and exact methods to solve the vehicle ...
The solution method presented consists of two parts. The iterative improvement heuristic is used to solve the combinatorial problem of finding the vessel routes and an LP model is used to find time for calls and quantity to load or discharge. The method is implemented in C++, using callable CPLEX for solving the LP problems.

In this survey we discuss different state-of-the-art approaches of combining exact algorithms and metaheuristics to solve combinatorial optimization problems. Some of these hybrids mainly aim at providing optimal solutions in shorter time, while others primarily focus on getting better heuristic solutions.

Exact and heuristic methods for the vertex separator problem. ... Another interesting aspect of our approach, due to the combining heuristic and linear integer programming, is the possibility to know how the solution we obtain is close to an optimal solution. This is particularly important when the instances are large, and consequently it is ...

Combining Metaheuristics and Exact Algorithms 43 the algorithms are executed sequentially or in an intertwined or even paral-lel way. 2.1 Sequential Execution Either the exact method is executed as a kind of preprocessing before the meta-heuristic, or vice-versa. Exact solutions versus the heuristic method. The heuristic approach is a mathmatical method with which proof of a good solution to a problem is delivered. There is a large number of different problems that could use good solutions. When the processing speed is equally as important as the obtained solution, we speak of a heuristic method.

The result of combining a metaheuristic and an exact method does not necessarily have to be a heuristic method. Metaheuristics can be integrated with exact methods to improve the performance of the exact methods (Friden et al., 1989, Glover, 1990, Puchinger et al., 2009).

The vehicle routing problem with pickups, deliveries and time windows (PDPTW) is an important member in the class of vehicle routing problems. In this paper a general heuristic to construct an initial feasible solution is proposed and compared with other construction methods. New route reconstruction heuristics are then shown to improve on this.
