My question is given a general Commutative Banach Algebra, is the intersection of two boundaries always a boundary? I came across a term called Shilov Boundary and in the book called Commutative Normed Rings written by Gelfand (Chapter 11), I found the proof for the unique existence of minimal boundary, which is the Shilov Boundary.

In mathematics, especially functional analysis, a Banach algebra, named after Stefan Banach, is an associative algebra A over the real or complex numbers (or over a non-Archimedean complete normed field) that at the same time is also a Banach space, i.e. a normed space and complete in the metric induced by the norm.

One might also define a normed ring to be a commutative monoid internal to the monoidal category of normed groups. If the morphisms in are taken to be the short group homomorphisms and the projective cross norm is used on the tensor product, then this reproduces the definition above.

The most highly developed of these theories is that of commutative normed rings, that is, normed rings in which multiplication is commutative: $xy = yx$. This theory was developed by I. M. Gel'fand. Normed rings are also called Banach algebras.

Derivations on Commutative Normed Algebras.

A normed ring "should" be a monoid object in the monoidal category of normed abelian groups. There are (at least) two choices of morphisms of normed groups, namely bounded or short homomorphisms, resulting in two definitions of a normed ring: Concretely, a normed ring is a ring R (not necessarily commutative)...

In ring theory, a branch of abstract algebra, a commutative ring is a ring in which the multiplication operation is commutative. The study of commutative rings is called commutative algebra. Complementarily, noncommutative algebra is the study of noncommutative rings where multiplication is not required to be commutative.

normed ring in nLab

We are concerned with derivations on commutative Banach algebras over the complex field, where by a Banach algebra we mean a normed algebra \mathfrak{A} which is complete in its norm. The radical of \mathfrak{A} is the intersection of all maximal ideals M in \mathfrak{A} which are such that \mathfrak{A}/M has a unit.
