Surgery is the treatment of choice for patients with non–small cell lung cancer (NSCLC) stages I through IIIA. [] In addition, patients with resected lung cancer have a high risk of relapse and so are treated with adjuvant chemotherapy. [] Patients with stage IIIB and IV NSCLC are usually offered chemotherapy with the option of surgery.

Urea is a nitrogenous compound containing a carbonyl group attached to two amine groups with osmotic diuretic activity. In vivo, urea is formed in the liver via the urea cycle from ammonia and is the final end product of protein metabolism. Administration of urea elevates blood plasma osmolality, resulting in enhanced flow of water from tissues, including the brain, cerebrospinal fluid and eye ...
