The drive unit is contained in the “moving mass” and creates the vibratory motion. Single-mass units are anchored in position (usually to the floor) and transfer the drive’s vibration directly to the tray or trough through its springs. By using the factory’s floor as a reaction base, a single-mass conveyor can be destructive

Conveyors are material handling systems that allow for easy transporting of products, from powder to bulk to complicated geometries. They are integral to all kinds of systems, as they provide a fast and safe method of handling large volumes of materials. There are many kinds of conveyors, but their working principle remains constant across each type; move objects via gravity or by mechanical ...

Some higher-end drives also include frequency outputs for speed reference. A drive's analog input typically accepts a speed command from a PLC or remote potentiometer. These analog signals are typically 0 to 10 volts DC, 4 to 20 milliamps or something similar. The drive's analog output, where available, also has the same signal levels.

In these applications, the main drive must start and stop the positioning conveyor with moderate to high precision. While DC and AC motors are popularly used to maintain velocity control for fixed or constant speed conveyor applications, step and servo motors offer more precise positioning capabilities for conveyors requiring more exact precision movement.
