The MES IP is a tri-speed (1GE; 100M; 10M) scalable and highly-optimized Ethernet Switch implementable on Xilinx families FPGAs. The switching structure is based on a full-crossbar non-blocking interconnection matrix between the ports. This approach ensures wire-speed frame processing and a very low latency times.

### Ethernet crossover cable - Wikipedia

A network bridge is a computer networking device that creates a single aggregate network from multiple communication networks or network segments. This function is called network bridging. Bridging is distinct from routing. Routing allows multiple networks to communicate independently and yet remain separate, whereas bridging connects two separate networks as if they were a single network.

In this paper, we present an original design for an Ethernet switch with crosspoint-queued crossbar switching fabric and analyze its performance. Recently, significant progress has been made on the performance analysis of crosspoint queued crossbar switches using analytical and simulation methods. We propose a hardware implementation on the NetFPGA platform that can provide n

Fault Tolerant Ethernet Overview and Implementation Guide

An Ethernet crossover cable is a crossover cable for Ethernet used to connect computing devices together directly. It is most often used to connect two devices of the same type, e.g. two computers (or their network interface controllers) or two switches to each other. By contrast, straight through cables are used to connect devices of different types, such as a computer to a network switch.

Unmanaged switches are less expensive, but you actually lose control of your network. The unmanaged switch decides the best data rate to use, a process known as autonegotiation. It chooses between full-duplex (data moving in two directions at the same time) and half-duplex (data moving in either one direction or another).
