X-ray fluorescence (XRF) is the emission of characteristic "secondary" (or fluorescent) X-rays from a material that has been excited by being bombarded with high-energy X-rays or gamma rays. The phenomenon is widely used for elemental analysis and chemical analysis, particularly in the investigation of metals, glass, ceramics and building materials, and for research in geochemistry,

structure of Cr-doped MnBi. The magnon spectrum of MnBi at 5 K was been measured by Williams et al. using inelastic neutron scattering [21]. The hexagonal phase was assumed in the analysis of results, which is likely to be a good approximation due to the strong similarity with the orthorhombic phase expected at low temperatures [21]. The magnon
