Based on the mechanical enhancement and tissue adhesion of TA, Yang et al. proposed a novel design strategy for developing a bone adhesive by mixing TA, SF, and inorganic hydroxyapatite (HAP). The adhesive was formed spontaneously based on the interactions between TA and SF and ionic complexation between TA and HAP ( Fig. 7 E and 7 F) [136] .

Hi Edwina, In Jackie French's book 'Jackie French's Guide to Companion Planting in Australia and New Zealand' – a great book which I highly recommend, she suggests growing corn nearby to attract parasitic wasps, which prey on leaf beetles. They don't normally have much trouble with pests and diseases though.

Buoyancy (/ ? b ?? ? n s i, ? b u? j ? n s i /), or upthrust, is an upward force exerted by a fluid that opposes the weight of a partially or fully immersed object. In a column of fluid, pressure increases with depth as a result of the weight of the overlying fluid. Thus the pressure at the bottom of a column of fluid is greater than at the top of the column.

Thermosiphon (or thermosyphon) is a method of passive heat exchange, based on natural convection, which circulates a fluid without the necessity of a mechanical pump. Thermosiphoning is used for circulation of liquids and volatile gases in heating and cooling applications such as heat pumps, water heaters, boilers and furnaces.

The loop method is straightforward to code, and looks a lot like the formula that defines the trapezoid method. The vectorized methods are not as easy to read, and take fewer lines of code to write. However, the vectorized methods are much faster than the loop, so the loss of readability could be worth it for very large problems.
