By breaking up your data in intervals in R, you still lose some information. Still, the most complete way of describing your data is by estimating the probability density function (PDF) or density of your variable. If this concept is unfamiliar to you, don't worry. Just remember that the density is proportional to the chance [...]

So imagine a tuning fork, you impact it and it starts to ring. Your capturing data for a finite amount of time, the software will have selected a time to capture based on your requested frequency range and frequency resolution (FFT block size), is the test structure still ringing? If so you need response windowing.

One of the most common ways to describe a single variable is with a frequency distribution. Depending on the particular variable, all of the data values may be represented, or you may group the values into categories first (e.g., with age, price, or temperature variables, it would usually not be sensible to determine the frequencies for each value.
