Design of structural timber connections - TRADA
There is a discrepancy between the actual behavior and the analysis of steel structure is large, therefore the connections are complex to analyze and design. When the structural member fails in case of overloading then there is a general practice to prefer the individual member rather than the connections, therefore this kind of practice affects many structural members.

Design Guide 7 provides a recommended design model for pinned base plates for both open and closed column sections subject to compression and tension actions and completes the revision of Structural Steel Connections, 4th edition, 1994 (often referred to as the 'Green Book').

Design of Structural Connections
Connections are an essential part of any structure, and in timber structures they are often the most critical part of a design. The timber section size is often determined by the strength of the section remaining after drilling holes for bolts or dowels, or by the spacing requirements for the fasteners, rather than the load-carrying capacity of the timber.

Design Guidelines for Wall Panel Connections
similar structural behaviour. This means in particular the application of limit state design methods which allow a better description of the real, non linear behaviour of a structure than allowable stress methods are capable of. However, the use of limit state design methods requires knowledge of the structural behaviour of members and connections.

Design Guidelines for Connections of Precast Structures ...
The book introduces all the aspects needed for the safe and economic design and analysis of connections using bolted joints in steel structures. This is not treated according to any specific standard but making comparison among the different norms and methodologies used in the engineering practice, e.g. Eurocode, AISC, DIN, BS. Several examples are solved and illustrated in detail, giving the ...
