Structural Design for Architecture. of structure is that the horizontal elements are subjected to bending-type internal forces under the action of gravitational load (normally the primary load on an architectural structure). This has two consequences.

Design of Structural Elements: Concrete, Steelwork ...

Structural engineering depends upon a detailed knowledge of loads, physics and materials to understand and predict how structures support and resist self-weight and imposed loads. To apply the knowledge successfully structural engineers will need a detailed knowledge of mathematics and of relevant empirical and theoretical design codes. They will also need to know about the corrosion ...
