Emission control systems for diesel engine vehicles. In today ' s world, environmental protection has advanced to become a topic of central concern. Many agencies and organizations are tried to prevent the damage on environment and human health caused by greenhouse gases and pollutant emissions.

Emission Control Systems for diesel engines

Diesel Emission Control. DE-TRONIC provides the link between the engine, the diesel after treatment system, the user and the service engineer. DE-TRONIC monitors back pressure and controls active regeneration,FBC dosing and urea injection, enabling total fleet control and management.

Diesel Engine Emissions Control - Micropump

The diesel engine, named after Rudolf Diesel, is an internal combustion engine in which ignition of the fuel is caused by the elevated temperature of the air in the cylinder due to the elevated temperature of the air in the cylinder due to the mechanical compression (adiabatic compression); thus, the diesel engine is a so-called compression-ignition engine (CI engine).This contrasts with engines using spark plug-ignition of the air-fuel mixture, such ...

Diesel Engine Emissions and Their Control | Johnson ...

Emission control by recycling a portion of the exhaust gasses back to the engine intake. It lowers oxide emissions by starving the engine of unnecessary oxygen. EGR works with ignition and is contrasted to SCR which cleans post ignition. The logical future of emission control technologies is to combine EGR technology with SCR technology in the ...

Diesel exhaust is the gaseous exhaust produced by a diesel type of internal combustion engine, plus any contained particulates.Its composition may vary with the fuel type or rate of consumption, or speed of engine operation (e.g., idling or at speed or under load), and whether the engine is in an on-road vehicle, farm vehicle, locomotive, marine vessel, or stationary generator or other ...

Emission Control For Diesel Engine - Mechanical Project

The major challenge in the design of diesel filter system is to regenerate the trap from collected particulate matter in a reliable and cost-effective manner. So far diesel filters are used commercially only in a few specialized diesel engine applications. Diesel catalysts control emissions by promoting chemical changes in the exhaust gas.

Diesel Engine Emission Control : Description: The use of Selective Catalytic Reduction (SCR) to remove NOx from the exhaust of diesel engines : How Used: A gear pump is used to inject Urea into the exhaust of the diesel engine. The Urea combines with the exhaust and converts the NOx to nitrogen and water in the catalytic converter : Key Feature

Diesel exhaust - Wikipedia

Catalytic Combustion Corporation engineers, designs, and manufactures emission control systems for rail and marine diesel engines in new and retrofit situations. Transportation industries such as marine and locomotives often rely on diesel engines to move equipment and for power generation.

Diesel Emissions and Their Control - SAE International

An excellent source of information is the Health and Safety Executive publication entitled Control of diesel engine exhaust emissions in the workplace Footnote 2. The publication identifies warehouses, depots, and bus garages as work places where diesel engine exhaust emissions are common occupational exposures.

The Emission Control Technologies Optimizing Diesel Engines

Diesel Emissions and Their Control R-303 Table of Contents This book will assist readers in meeting today's tough challenges of improving diesel engine emissions, diesel efficiency, and public perception of the diesel engine.

Diesel Engine Emission Control

Electronic control is a powerful tool to solve many traditional diesel engine control problems, such as cold start, load response, governing, or transient smoke emission. In SI engines, electronic control is critical for the operation of the three way catalyst, cold start enrichment and idle speed control.

How Can We Control Diesel Emissions? Emissions From Diesel ...

This review covers recent developments in regulations to limit diesel emissions, engine technology, and remediation of nitrogen oxides (NOx) and particulate matter (PM). The geographical focus of regulatory development is now the European Union (EU), where Euro V and Euro VI regulations for light-duty engines have been finalised for implementation in 2009 and 2014, respectively.
