What is Seed Germination? - Definition, Process, Steps ...

Germination occurs in many seeds as soon as moist, warm conditions are available. These immediately stimulate enlargement in a system which had previously remained constant in size. The promotion of activity ultimately leads to the establishment of the normal, growing organism, but the change is a gradual one, and although the beginning of germination is well enough defined its termination is ...

Physiology of Seed Germination - Biology Discussion

Seeds are highly dehydrated and naturally require water before germination. The first phase of seed germination is water imbibition till critical level of water is attained. Once the imbibition is completed, seeds begin to germinate and seedling emerges out. Radicle or root penetrates the seed coat and is followed by shoot emergence.
