Dry stone retaining structures are structures made of individual decimeter stone blocks in contact. One advantage of this construction technology lies in the weak amount of embodied energy required for their construction, and uses only local materials.

#### Stone Wall Design and Specifications - The Stone Trust

How to build a drystone retaining wall. After you place each stone or course of stones, you should fill the spaces between, behind, and below the stones with "hearting" (chips of stone or gravel). The pieces should be as large as you can fit in the space, and if it fits in your mouth, it is too small.

Dry stone retaining walls are vernacular structures that can be found in many places around the world and were mainly built to reduce slope erosion and to allow agricultural practices.

#### Yield design modelling of dry-stone retaining walls

Dry-stone masonry retaining walls represent a traditional form of construction which can be found all over the world, i.e., in Asia, Africa, North and Latin America, Europe and Australia (Colas et al., 2008). Such walls are composed of a lot of stones interlocked with each other without mortar.

These dry stone structures (dry meaning built without mortar) define fields and properties, retain slopes, support bridges, buildings, and much more. They are functional and beautiful and are a continuing part of our history and landscape.

#### 3D failure of a scale-down dry stone retaining wall: A DEM ...

Dry stone, sometimes called drystack or, in Scotland, drystane, is a building method by which structures are constructed from stones without any mortar to bind them together. Dry stone structures are stable because of their unique construction method, which is characterized by the presence of a load-bearing façade of carefully selected interlocking stones.

#### Dry Stone Retaining Structures DEM Modeling - ePub - Eric ...

Dry stone retaining walls are vernacular structures that can be found in many places around the world and were mainly built to reduce slope erosion and to allow agricultural practices. Their stability is essentially warranted by the global wall weight and the capacity of individual blocks to develop friction at contact.
