Ground–structure interaction (SSI) consists of the interaction between soil (ground) and a structure built upon it. It is primarily an exchange of mutual stress, whereby the movement of the ground-structure system is influenced by both the type of ground and the type of structure. This is especially applicable to areas of seismic activity. Various combinations of soil and structure can either ...

In a dynamic soil–structure-interaction analysis a bounded structure (which may be linear or nonlinear), consisting of the actual structure and an adjacent irregular soil if present, will interact with the unbounded (infinite or semi-infinite) soil which is assumed to be linear elastic ().The most striking feature in an unbounded soil, which is never encountered in a bounded medium is, in ...

A simple thin-layer element is developed and used in a finite element procedure for simulation of various modes of deformation in dynamic soil-structure interaction. The constitutive behavior of the interface is defined by decomposing it into its normal and shear components. The soil is modeled as an elastic-plastic hardening material.
